5. Conclusion

Issue

- In automatically generated programs using floating point arithmetics, some computations may diverge because of rounding errors.
- We prove the absence of floating point number overflows:
we bound rounding errors at each loop iteration by a linear combination of the loop inputs; we get bounds on the values that depends exponentially on the program execution time.
- We use non polynomial constraints. Our domain is both precise (no false alarm) and efficient (linear in memory / $n \ln(n)$ in time).

Overview

1. Introduction
2. Case study
3. Arithmetic-geometric progressions
4. Benchmarks
5. Conclusion

Running example (in \mathbb{R})

```
1 : X := 0; k := 0;  
2 : while (k < 1000) {  
3 :   if (?) {X ∈ [-10; 10]};  
4 :   X := X/3;  
5 :   X := 3 × X;  
6 :   k := k + 1;  
7 : }
```

Interval analysis: first loop iteration

```
1 : X := 0; k := 0;                                X = 0
2 : while (k < 1000) {                            X = 0
3 :   if (?) {X ∈ [-10; 10]};                      |X| ≤ 10
4 :   X := X/3;                                    |X| ≤ 10/3
5 :   X := 3 × X;                                  |X| ≤ 10
6 :   k := k + 1;                                 |X| ≤ 10
7 : }
```

Interval analysis: Invariant

```
1 : X := 0; k := 0;                                X = 0
2 : while (k < 1000) {                            |X| ≤ 10
3 :   if (?) {X ∈ [-10; 10]};                      |X| ≤ 10
4 :   X := X/3;                                    |X| ≤ 10/3
5 :   X := 3 × X;                                |X| ≤ 10
6 :   k := k + 1;                                 |X| ≤ 10
7 : }
```

$|X| \leq 10$

Including rounding errors [Miné–ESOP'04]

```
1 : X := 0; k := 0;  
2 : while (k < 1000) {  
3 :   if (?) {X ∈ [-10; 10]};  
4 :   X := X/3 + [-ε₁; ε₁].X + [-ε₂; ε₂];  
5 :   X := 3 × X + [-ε₃; ε₃].X + [-ε₄; ε₄];  
6 :   k := k + 1;  
7 : }
```

The constants ε_1 , ε_2 , ε_3 , and ε_4 (≥ 0) are computed by other domains.

Interval analysis

Let $M \geq 0$ be a bound:

```
1 : X := 0; k := 0;                                X = 0
2 : while (k < 1000) {                            |X| ≤ M
3 :   if (?) {X ∈ [-10; 10]};                      |X| ≤ max(M, 10)
4 :   X := X/3 + [-ε₁; ε₁].X + [-ε₂; ε₂];        |X| ≤ (ε₁ + 1/3) × max(M, 10) + ε₂
5 :   X := 3 × X + [-ε₃; ε₃].X + [-ε₄; ε₄];        |X| ≤ (1 + a) × max(M, 10) + b
6 :   k := k + 1;
7 : }
```

with $a = 3 \times \varepsilon_1 + \frac{\varepsilon_3}{3} + \varepsilon_1 \times \varepsilon_3$ and $b = \varepsilon_2 \times (3 + \varepsilon_3) + \varepsilon_4$.

Ari.-geo. analysis: first iteration

```
1 : X := 0; k := 0;                                X = 0, k = 0
2 : while (k < 1000) {                            X = 0
3 :   if (?) {X ∈ [-10; 10]};                      |X| ≤ 10
4 :   X := X/3 + [-ε1; ε1].X + [-ε2; ε2];      |X| ≤ [v ↦ (1/3 + ε1) × v + ε2] (10)
5 :   X := 3 × X + [-ε3; ε3].X + [-ε4; ε4];      |X| ≤ f(1)(10)
6 :   k := k + 1;                                    |X| ≤ f(k)(10), k = 1
7 : }
```

with $f = [v \mapsto (1 + 3 \times \varepsilon_1 + \frac{\varepsilon_3}{3} + \varepsilon_1 \times \varepsilon_3) \times v + \varepsilon_2 \times (3 + \varepsilon_3) + \varepsilon_4]$.

Ari.-geo. analysis: Invariant

```

1 : X := 0; k := 0;                                X = 0, k = 0
2 : while (k < 1000) {                            |X| ≤ f^(k)(10)
3 :   if (?) {X ∈ [-10; 10]};                      |X| ≤ f^(k)(10)
4 :   X := X/3 + [-ε₁; ε₁].X + [-ε₂; ε₂];        |X| ≤ (1/3 + ε₁) × (f^(k)(10)) + ε₂
5 :   X := 3 × X + [-ε₃; ε₃].X + [-ε₄; ε₄];        |X| ≤ f(f^(k)(10))
6 :   k := k + 1;                                  |X| ≤ f^(k)(10)
7 : }

```

$$|X| \leq f^{(1000)}(10)$$

with $f = [v \mapsto (1 + 3 \times \varepsilon_1 + \frac{\varepsilon_3}{3} + \varepsilon_1 \times \varepsilon_3) \times v + \varepsilon_2 \times (3 + \varepsilon_3) + \varepsilon_4]$.

Analysis session

The screenshot shows the Visualizer application window. The title bar reads "Visualizer". The menu bar includes "Quit", "Intervals", "Clocks", "Trees", "Octagons", "Filters", "Geom. dev.", "Symbolics", and "Help". Below the menu is a search bar with "Search string:" and buttons for "Next", "Previous", "First", "Last", and "Goto line:". A toolbar below the search bar has buttons for "Program points: Current", "Next", "Prev", "Step", "Backstep", "Variables: All", and "Choose...". The main area displays a C program named "example2.c" with syntax highlighting and annotations. The code is:

```
example2.c
void main()
{
    ● a = -10; ● b = 10; ● alpha = 3;
    ● while ((1 == 1))
    {
        ● if (B1) {● X=NUM_input;●}
        ● X = X/alpha;
        ● X = X*alpha;
        ● __ASTREE_wait_for_clock ();
    }
}
```

The bottom panel shows analysis results:

```
location: example2.c:14:33:[call#main@8:loop@10>=4:]
variables: X (10)
invariant:
|X| <= (10. + 2.35098891184e-38/(1.00000023842-1))*(1.00000023842)^clock - 2.35098891184e-38/(1.00000023842-1)
<= 23.5916342108
example2.c – line 14 – column 33 – character 316
```

Overview

1. Introduction

4. Benchmarks
5. Conclusion

Arithmetic-geometric progressions (in \mathbb{R})

An arithmetic-geometric progression is a 5-tuple in $(\mathbb{R}^+)^5$.

An arithmetic-geometric progression denotes a function in $\mathbb{N} \rightarrow \mathbb{R}^+$:

$$\beta_{\mathbb{R}}(M, a, b, a', b')(k) \triangleq [v \mapsto a \times v + b] \left([v \mapsto a' \times v + b']^{(k)}(M) \right)$$

Thus,

- k is the loop counter;
- M is an initial value;
- $[v \mapsto a \times v + b]$ describes the current iteration;
- $[v \mapsto a' \times v + b']^{(k)}$ describes the first k iterations.

A concretization $\gamma_{\mathbb{R}}$ maps each element $d \in (\mathbb{R}^+)^5$ to a set $\gamma_{\mathbb{R}}(d) \subseteq (\mathbb{N} \rightarrow \mathbb{R}^+)$ defined as:

$$\{f \mid \forall k \in \mathbb{N}, |f(k)| \leq \beta_{\mathbb{R}}(d)(k)\}$$

Monotonicity

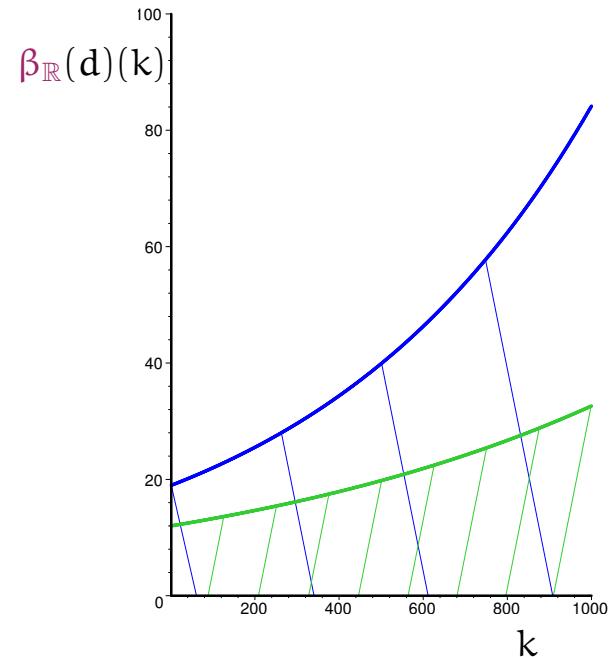

Let $d = (M, a, b, a', b')$ and $d' = (M', a', b', a'', b'')$ be two arithmetic-geometric progressions.

If:

- $M \leq M'$,
- $a \leq a'$, $a' \leq a''$,
- $b \leq b'$, $b' \leq b''$.

Then:

$$\forall k \in \mathbb{N}, \beta_{\mathbb{R}}(d)(k) \leq \beta_{\mathbb{R}}(d')(k).$$

Disjunction

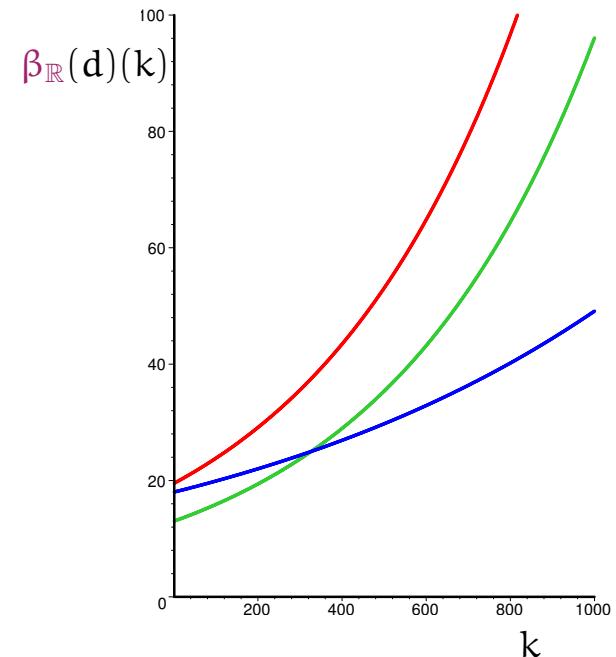

Let $d = (M, a, b, a', b')$ and $d = (M, a, b, a', b')$ be two arithmetic-geometric progressions.

We define:

$$d \sqcup_{\mathbb{R}} d \triangleq (M, a, b, a', b')$$

where:

- $M \triangleq \max(M, M)$,
- $a \triangleq \max(a, a)$, $a' \triangleq \max(a', a')$,
- $b \triangleq \max(b, b)$, $b' \triangleq \max(b', b')$,

For any $k \in \mathbb{N}$, $\beta_{\mathbb{R}}(d \sqcup_{\mathbb{R}} d)(k) \geq \max(\beta_{\mathbb{R}}(d)(k), \beta_{\mathbb{R}}(d)(k))$.

Conjunction

Let $\textcolor{green}{d}$ and $\textcolor{blue}{d}$ be two arithmetic-geometric progressions.

1. If $\textcolor{green}{d}$ and $\textcolor{blue}{d}$ are comparable (component-wise), we take the smaller one:

$$\textcolor{green}{d} \sqcap_{\mathbb{R}} \textcolor{blue}{d} \stackrel{\Delta}{=} \inf_{\leq} \{\textcolor{green}{d}; \textcolor{blue}{d}\}.$$

2. Otherwise, we use a parametric strategy:

$$\textcolor{green}{d} \sqcap_{\mathbb{R}} \textcolor{blue}{d} \in \{\textcolor{green}{d}; \textcolor{blue}{d}\}.$$

For any $k \in \mathbb{N}$, $\beta_{\mathbb{R}}(\textcolor{green}{d} \sqcap_{\mathbb{R}} \textcolor{blue}{d})(k) \geq \min(\beta_{\mathbb{R}}(\textcolor{green}{d})(k), \beta_{\mathbb{R}}(\textcolor{blue}{d})(k))$.

Assignment (I/III)

We have:

$$\begin{aligned}\beta_{\mathbb{R}}(M, a, b, a', b')(k) &= a \times (M + b' \times k) + b && \text{when } a' = 1 \\ \beta_{\mathbb{R}}(M, a, b, a', b')(k) &= a \times \left((a')^k \times \left(M - \frac{b'}{1-a'} \right) + \frac{b'}{1-a'} \right) + b && \text{when } a' \neq 1.\end{aligned}$$

Thus:

1. for any $a, a', M, b, b', \lambda \in \mathbb{R}^+$,

$$\lambda \times \left(\beta_{\mathbb{R}}(M, a, b, a', b')(k) \right) = \beta_{\mathbb{R}}(\lambda \times M, a, \lambda \times b, a', \lambda \times b')(k);$$

2. for any $a, a', M, b, b', M, b, b' \in \mathbb{R}^+$, for any $k \in \mathbb{N}$,

$$\beta_{\mathbb{R}}(M, a, b, a', b')(k) + \beta_{\mathbb{R}}(M, a, b, a', b)(k) = \beta_{\mathbb{R}}(M + M, a, b + b, a', b' + b')(k).$$

Assignment (II/III)

For $k \in \mathbb{N}$, if:

$$|X_i| \leq \beta_{\mathbb{R}}(M_i, a_i, b_i, a'_i, b'_i) (k)$$

then:

$$\frac{|B + \sum \alpha_i \times X_i| - |B|}{\sum |\alpha_i|} \leq \beta_{\mathbb{R}}\left(\frac{\sum |\alpha_i| \times M_i}{\sum |\alpha_i|}, \text{Max}(a_i), \frac{\sum |\alpha_i| \times b_i}{\sum |\alpha_i|}, \text{Max}(a'_i), \frac{\sum |\alpha_i| \times b'_i}{\sum |\alpha_i|}\right) (k)$$

so:

$$|B + \sum \alpha_i \times X_i| \leq \beta_{\mathbb{R}}\left(\frac{\sum |\alpha_i| \times M_i}{\sum |\alpha_i|}, \sum |\alpha_i| \times \text{Max}(a_i), \frac{\sum |\alpha_i| \times b_i}{\sum |\alpha_i|} + |B|, \text{Max}(a'_i), \frac{\sum |\alpha_i| \times b'_i}{\sum |\alpha_i|}\right) (k)$$

Assignment (III/III)

If for $k \in \mathbb{N}$, $|X| \leq \beta_{\mathbb{R}}(M_X, a_X, b_X, a'_X, b'_X)(k)$ and $|Y| \leq \beta_{\mathbb{R}}(M_Y, a_Y, b_Y, a'_Y, b'_Y)(k)$, then:

1. increment:

$$|X + 3| \leq \beta_{\mathbb{R}}(M_X, a_X, b_X + 3, a'_X, b'_X)(k)$$

2. multiplication:

$$|3 \times X| \leq \beta_{\mathbb{R}}(M_X, 3 \times a_X, b_X, a'_X, b'_X)(k)$$

3. barycentric mean:

$$\left| \frac{X + Y}{2} \right| \leq \beta_{\mathbb{R}} \left(\frac{M_X + M_Y}{2}, \text{Max}(a_X, a_Y), \frac{b_X + b_Y}{2}, \text{Max}(a'_X, a'_Y), \frac{b'_X + b'_Y}{2} \right) (k)$$

Parametric strategies can be used to transform expressions.

Projection I

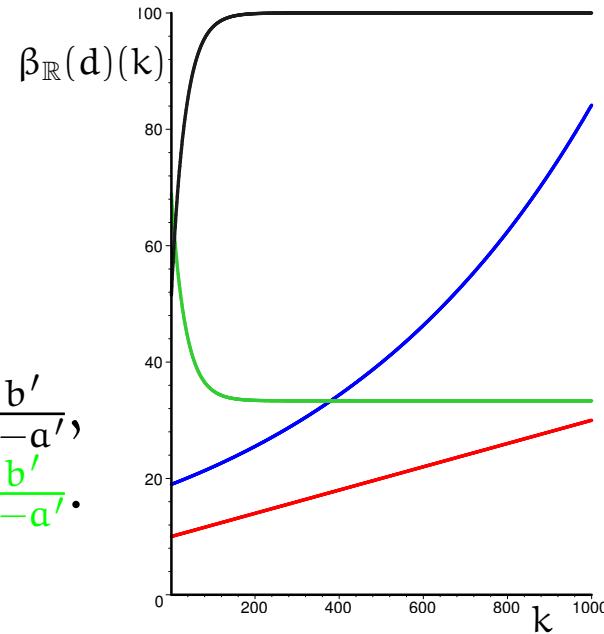

$$\beta_{\mathbb{R}}(M, a, b, a', b')(k) = a \times (M + b' \times k) + b \quad \text{when } a' = 1$$

$$\beta_{\mathbb{R}}(M, a, b, a', b')(k) = a \times \left((a')^k \times \left(M - \frac{b'}{1-a'} \right) + \frac{b'}{1-a'} \right) + b \quad \text{when } a' \neq 1.$$

Thus, for any $d \in (\mathbb{R}^+)^5$,
 the function $[k \mapsto \beta_{\mathbb{R}}(d)(k)]$ is:

- either monotonic,
- or anti-monotonic.

$$\begin{cases} a' > 1, \\ a' = 1, \\ a' < 1 \text{ and } M < \frac{b'}{1-a'}, \\ a' < 1 \text{ and } M > \frac{b'}{1-a'}. \end{cases}$$

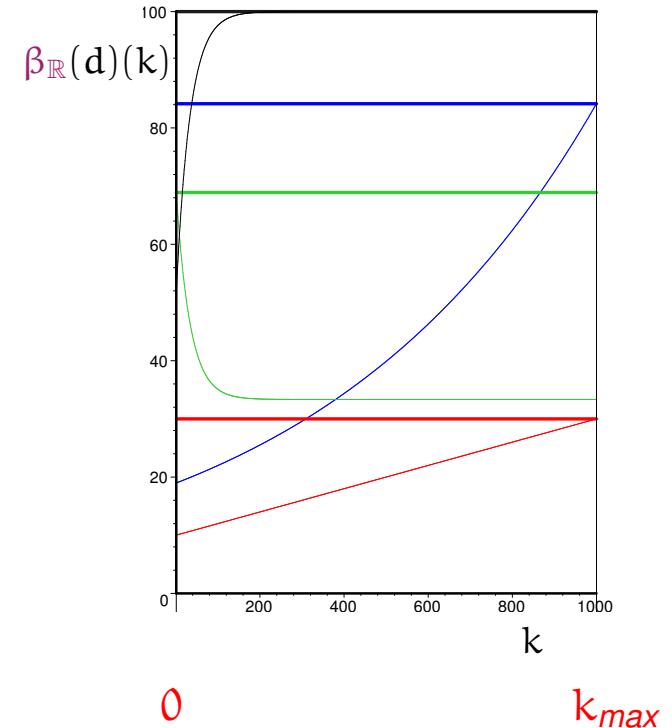

Projection II

Let $d \in (\mathbb{R}^+)^5$ and $k_{max} \in \mathbb{N}$.

$$bound(d, k_{max}) \stackrel{\Delta}{=} \max(\beta_{\mathbb{R}}(d)(0), \beta_{\mathbb{R}}(d)(k_{max}))$$

For any $k \in \mathbb{N}$ such that $0 \leq k \leq k_{max}$:

$$\beta(d)(k) \leq bound(d, k_{max}).$$

Incrementing the loop counter

We integrate the current iteration into the first k iterations:

- the first $k + 1$ iterations are chosen as the worst case among the first k iterations and the current iteration;
- the current iteration is reset.

Thus:

$$\text{next}_{\mathbb{R}}(M, a, b, a', b') \triangleq (M, 1, 0, \max(a, a'), \max(b, b')).$$

For any $k \in \mathbb{N}$, $d \in (\mathbb{R}^+)^5$, $\beta_{\mathbb{R}}(d)(k) \leq \beta_{\mathbb{R}}(\text{next}_{\mathbb{R}}(d))(k + 1)$.

About floating point numbers

Floating point numbers occur:

1. in the concrete semantics:

Floating point expressions are translated into real expressions with interval coefficients [Miné—ESOP'04].

In other abstract domains, we handle real numbers.

2. in the abstract domain implementation:

For efficiency purpose, we implement each primitive in floating point arithmetics: each real is safely approximated by an interval with floating point number bounds.

Overview

1. Introduction
2. Case study
3. Arithmetic-geometric progressions
4. Benchmarks
5. Conclusion

Applications

Arithmetic-geometric progressions provide bounds for :

1. division by α followed by a multiplication by α :
 \Rightarrow our running example;
2. barycentric means:
 \Rightarrow at each loop iteration, the value of a variable X is computed as a barycentric mean of some previous values of X
(not necessarily the last values);
3. bounded incremented variables:
 \Rightarrow it replaces the former domain that bounds the difference and the sum between each variable and the loop counter.

Benchmarks

We analyze three programs in the same family on a AMD Opteron 248, 8 Gb of RAM (analyses use only 2 Gb of RAM).

lines of C	70,000			216,000			379,000		
global variables	13,400			7,500			9,000

1. without using computation time;
2. with the former loop counter domain,
(without the arithmetic-geometric domain);
3. with the arithmetic-geometric domain,
(without the former loop counter domain).

Overview

1. Introduction
2. Case study
3. Arithmetic-geometric progressions
4. Benchmarks
5. Conclusion

A new abstract domain

- non polynomial constraints;
- sound with respect to rounding errors
(both in the concrete semantics and in the domain implementation);
- accurate
(we infer bounds on the values that depend on the execution time of the program);
- efficient:
 - in time: $\mathcal{O}(n \times \ln(n))$ per abstract iteration
(n denotes the program size),
 - in memory: at most 5 coefficients per variable in the program,
 - sparse implementation.
